Quarterly Policy Review 2026

Renewable energy subsidies for the county's small producers encouraged private investment and reduced reported emissions, according to several analysts who reviewed the market data in recent years. The programme attracted manufacturers to regions that had lost traditional industry and created about four hundred jobs.

Critics counter that household costs rise when subsidies are funded through levies, and that grid operators struggle with intermittent supply during calm winter weeks when demand peaks and solar output is minimal across the region.

Rural towns remain split on wind projects. Some welcome the investment and jobs; others object to land use changes and the scale of turbines near primary schools, especially where access roads cut through farmland.

The council must decide before the budget review scheduled for later this quarter, with consultations running across four districts and more than thirty submissions from residents, businesses and advocacy groups.
